ABOUT ME

I'm an outgoing, curious software engineer with a strong passion for computers, programming and tech. I've spent the past year and a half building software at a company developing AGVs. I've also completed my master's thesis in High Performance Computer Systems at Chalmers University of Technology. I tailored my studies toward software development and optimization and prioritized project-based courses to build practical, hands-on experience.

EDUCATION

Computer Science | University

August 2020 – Present

Gothenburg, Sweden

Attending **Chalmers University of Technology**

Master's Degree in High-Performance Computer Systems (August 2023 – Present)

Thesis completed: 'Evaluating the Impact of Compression on Inverted Index Search Engine Performance'. Degree pending.

Bachelor's Degree in Computer Science and Engineering (August 2020 – July 2023)

Relevant Courses: Computer Architecture, Game Engine Architecture, Game Development Project, Data Structures and Algorithms, Object-Oriented Programming, Machine-Oriented Programming, High-Performance Parallel Programming, Advanced Computer Graphics, Artificial Intelligence

EXPERIENCE

AGVE | System Engineer

August 2025 – Present

Gothenburg, Sweden

As a System Engineer in AGVE's R&D department, I develop the software that coordinates and manages our AGVs, working mainly in C# and .NET. My work includes designing and implementing deadlock resolution algorithms and improving the overall transportation flow, as well as building new infrastructure such as communication monitoring to make the system more robust and easier to troubleshoot. I work closely with our Japanese development partner, and I've travelled to Japan for on-site integration and troubleshooting of a system installation, gaining hands-on experience of running the software in a real production environment.

Volvo Car | Software Developer

May 2024 – August 2024

Gothenburg, Sweden

My work at Volvo Cars was as a summer intern supporting the Technical Leader of a team of around 15 people, in coding and processing data/models. During my time in this position I single handedly wrote and developed a Python application for inhouse use as a database and data visualizer, to help improve the teams CFD workflow. The application was developed using mainly python libraries: SQLite and QTWidgets.

Wanda Sweden | Gothenburg Representative

October 2022 – May 2024

Gothenburg, Sweden

Wanda opened their first warehouse in Gothenburg in October of 2022 and I was the first on-site employee. From there on I had the main responsibility for our operations in Gothenburg. Aside from the regular work was I was tasked with vetting and educating new employees as well as making sure everything around the warehouse and our services kept working. Since August of 2023 I also had the responsibility of route planning/capacity management for all of the warehouses in Sweden. At Wanda I developed a lot of experience in having big responsibilities and being in charge of overseeing large operations.

PROJECTS

Traffic Simulator | [Visit Repo](#)

📅 2023 – 2024

- Developed using C# in Unity

This project was the main work of my Bachelor's thesis and aims to simulate traffic flow using an agent based system. The application features autonomous vehicles driving around a road network that can either be created by the user, or imported from a real world location.

Game Engine | [Visit Repo](#)

📅 2024

- Developed using C++ and OpenGL

A 3D Game Engine with built in editor, written from scratch using OpenGL for graphics. Notable features:

- Physics Engine (Frame-rate independent)
 - Serialization
 - Scripting
 - Multiplayer
 - Graphical Interface Editor
 - Dynamic/Event based Input System
-

Raytracing in DirectX12 | [Visit Repo](#)

📅 2024

- Developed using C++/CUDA (DirectX12)

A realtime raytracing rendering engine using DirectX12. Notable features:

- Hardware accelerated raytracing
 - Ray traced ambient occlusion
 - Transparent and reflective materials
 - Procedural terrain generation
 - Various basic compute shaders
-

These projects were completed in teams of 4 to 7 members, providing me with valuable experience in managing larger-scale initiatives and coordinating parallel or simultaneous development efforts.
